Profile

DevOps/Platform Engineer with hands-on experience supporting production AWS environments and building automation solutions. Currently at AWS supporting distributed cloud infrastructure, developing Python and Bash automation tools, and collaborating with engineering teams to improve platform reliability. Experience with Kubernetes (EKS), CI/CD pipelines, Infrastructure as Code (Terraform), and monitoring using Prometheus and Grafana. Built projects including a custom Python app that queries the Kubernetes API to track cluster health and GitOps workflows using ArgoCD. Strong foundation in multi-cloud environments (AWS, Azure), security best practices, and operational excellence. Passionate about automation, reducing operational toil, and building reliable infrastructure that enables teams to deploy confidently.

Professional Experience

Systems Engineer, Amazon Web Services (AWS)

11/2025 – Present
Reading, UK

- Supported highly available AWS production environments, ensuring platform reliability, operational stability, and service availability
- Investigated and resolved infrastructure and application incidents across distributed cloud environments using monitoring, logging, and troubleshooting tools
- Developed and maintained automation tooling using Python and Bash to reduce manual operational effort and improve operational efficiency
- Worked with Linux-based systems to diagnose performance, networking, and application-related issues
- Supported CI/CD deployment processes and operational workflows across cloud environments
- Collaborated with engineering teams to improve platform reliability, operational processes, monitoring, and deployment practices
- Utilized AWS services including EC2, IAM, S3, VPC, Route53, ECS, ECR, and CloudWatch to support production workloads
- Created and maintained operational runbooks, troubleshooting documentation, and support procedures
- Participated in incident response activities, root cause investigations, and continuous improvement initiatives
- Worked with Git-based workflows and automation tooling to support infrastructure and deployment activities

IT Support Engineer, University of Salford

02/2023 – 10/2025
Manchester, UK

- Supported hybrid infrastructure across Microsoft Azure and on-premises platforms
- Worked alongside infrastructure teams supporting cloud services, virtual machines, networking, and identity management
- Assisted with infrastructure deployments using Azure DevOps pipelines and Bicep templates
- Supported Active Directory, Azure AD, DNS, networking, and user access management
- Performed troubleshooting across cloud and on-premise environments
- Collaborated with infrastructure and security teams to improve operational processes
- Created technical documentation, operational procedures, and knowledge base articles

Key Projects

Production-Grade EKS Platform with GitOps & Observability 📄

- **Custom Platform App:** Built EKS Status Hub a Python/Flask app that queries the Kubernetes API from inside the cluster to track live health of K8s components, with RBAC-scoped service account (get/list only), HPA autoscaling (1-3 replicas), and TLS via cert-manager
- **Container Orchestration:** Deployed production-grade EKS cluster across 3 AZs with automated TLS provisioning, eliminating manual certificate management

- **Infrastructure as Code:** Provisioned complete AWS infrastructure using Terraform (VPC, EKS, IAM, IRSA) with S3 remote state and fully automated pipelines
- **GitOps & CI/CD:** Implemented ArgoCD with GitHub Actions OIDC, Git as single source of truth, zero stored credentials, automatic image tag updates on every push
- **Security & Networking:** Enforced pod-level traffic isolation via NetworkPolicies, integrated Checkov + Gripe scanning catching misconfigurations before they reach the cluster
- **Observability:** Deployed Prometheus + Grafana stack with real-time metrics dashboards and full cluster visibility

Production-Grade ECS Platform with Infrastructure Automation

- **Container Orchestration:** Deployed Fider (open-source feedback platform) on ECS Fargate across 2 AZs with multi-stage Docker builds, reducing image size by 60%
- **Infrastructure as Code:** Provisioned complete AWS infrastructure using modular Terraform (VPC, ECS, RDS, ALB, ACM, Route 53, SES, Secrets Manager) with S3 remote state and native locking
- **Database:** RDS PostgreSQL 17 with Multi-AZ deployment, automated backups, and 70+ schema migrations managed automatically on container startup
- **CI/CD:** Three separate GitHub Actions pipelines (Docker build/push, Terraform deploy, health check) with OIDC authentication — zero stored credentials
- **Security & Networking:** Private subnets for ECS and RDS, security groups enforcing ALB → ECS → RDS traffic flow, least-privilege IAM, and AWS Secrets Manager for all sensitive values
- **DNS & TLS:** Route 53 + ACM with automatic certificate validation and HTTPS enforced end-to-end

Technical Skills

Cloud Platforms

AWS, Azure

Infrastructure as Code

Terraform, AWS CloudFormation, AWS CDK, Ansible

Container Orchestration

Docker, Kubernetes, Helm

CI/CD & Source Control

Git, GitHub Actions, ArgoCD, Azure DevOps

Programming & Scripting

Python, Bash

Monitoring & Observability

CloudWatch, Prometheus, Grafana

Security & Compliance

IAM, OIDC, AWS Secrets Manager, HashiCorp Vault, Checkov, Trivy, vulnerability scanning, security posture management, least-privilege access controls

Networking

TCP/IP, DNS, Routing, Load Balancing, Firewall, VPC Networking

Operating Systems

Linux (Ubuntu, Debian, Amazon Linux), Windows Server

Education & Certifications

BSc (Hons) Computer Networks, *University of Salford*

2018 – 2022

- Upper Second-Class Honours (2:1)

Manchester, UK

Certifications

AWS Certified Cloud Practitioner

Amazon Web Services

AZ-900: Microsoft Azure Fundamentals

Microsoft Certified

CoderCo DevOps Career Accelerator

In Progress (Focus: Kubernetes, Terraform, AWS, CI/CD, GitOps, Platform Engineering)
